- [1] Thomas H. Cormen, Charles E. Leiserson, Ronald L. Rivest, and Clifford Stein. *Introduction to Algorithms, Third Edition*. The MIT Press, 3rd edition, 2009.

This is a popular algorithms textbook which is well-cited. In particular, Part VI on graph algorithms will be of interest. Chapter 26 discusses flow networks and introduces commonly used notation. It formally describes the problem of obtaining a maximum flow and its equivalence to obtaining a minimum cut. The classical method of Ford and Fulkerson’s algorithm for finding a maximum flow is described, and it includes several examples. Additional methods for obtaining a maximum flow, including the push-relabel method, are also described. The chapter notes include additional references to specific articles which may be helpful, such as those of historical interest (the article in which an algorithm was originally proposed) as well as state-of-the-art improvements (more recent articles to improve the approach).

- [3] Aparna Vinayan Kozhipuram, Samar Shailendra, and Rajan Kadel. Retrieval-augmented generation vs. baseline llms: A multi-metric evaluation for knowledge-intensive content. *Information*, 16(9), 2025.

This paper compared four LLMs (from 1.1 Billion parameters to 13 Billion parameters), to see if Retrieval Augmented Generation (RAG) helps smaller models catch up to big ones. The models used were TinyLlama 1.1B, Mistral 7B, Llama 3.1 8B and Llama 1 13 B. RAG is an AI architecture that optimizes the performance of models by allowing them to access external knowledge bases, enabling them to generate responses based on real, up-to-date data rather than solely relying on their training data. Unlike LLMs that rely

on static training data, RAG pulls relevant text from databases, uploaded documents, or web sources. The researchers used a "multi -metric" approach using seven lexical and semantic scores to evaluate the performance gains of RAG LLM's over baseline LLMs. This is a 2025 peer reviewed article from the Information Journal, published by MDPI. Since I am interested in Environmental Studies and Data Science, one area of research for me could be looking into how RAG models might be more sustainable or cheaper to run compared to massive models.
